SMS 204: Integrative marine sciences

1

From last week: Equation of state of an ideal gases

$$PV=nRT$$

- Temperature: kinetic energy of molecules ([applet](#)).
- Pressure: momentum transfer (normal) to sides of container.
- Viscosity: momentum transfer between molecules.

In class demonstration (change of volume with pressure)

1/31/17

SMS 204: Integrative marine sciences

2

The magic of the hydraulic press:

- Pressure (non-hydrostatic) is equal within the fluid.
- $\rightarrow F_1/A_1 = F_2/A_2$
- $\rightarrow F_2 = F_1 A_2/A_1$
- $\rightarrow F_1 < F_2$
- We can use a small force to lift a heavy object if we apply it over a long distance (remember $\text{work} = \text{force} \times \text{distance}$).

1/31/17

SMS 204: Integrative marine sciences

3

Two kinds of pumps:

- Positive displacement pump (decrease in volume raises pressure , e.g. a bicycle pump)
- Fluid dynamic pump (add thrust to the fluid through moving parts).
- Positive displacement pumps tend to be better at producing high pressures. Fluid dynamic pumps are better at producing large volumetric flow rates.

1/31/17

SMS 204: Integrative marine sciences

6

Summary

- Water organizes itself by density if there are no forces acting on it.
- Water flows from high to low pressure.
- Pumps are useful as tools to get food and get rid of waste products.
- If you care about diving (or organisms that dive) you should worry about pressure.

1/31/17

SMS 204: integrative marine sciences

7

- Some important concepts from last week:
 - Hydrostatic pressure- weight of water/area
 - Continuity $v \times A = \text{constant}$

1/31/17

SMS 204: integrative marine sciences

8

- Archimedes's principle:
 - The buoyancy force is equal to the weight of the liquid displaced by the object (where is this force coming from?)

For a floating object:

$$F_{\text{buoyancy}} = V_{\text{displaced}} \rho_{\text{water}} g$$

$$m a = F_{\text{gravity}} - F_{\text{buoyancy}} = 0$$

What is the balance of forces for a sinking object?

1/31/17

SMS 204: integrative marine sciences

9

• **Center of buoyancy vs. center of gravity:**

Center of gravity:

$$\vec{r}_c = \sum_i \frac{\vec{r}_i m_i}{m_i}$$

Center of buoyancy:
Center of gravity of displaced fluid.

When center of buoyancy is below the center of gravity the situation is unstable.

Separate centers of gravity and buoyancy allow organisms and plants to orient relative to the gravitational field:

e.g. dinoflagellates, kelp.

SMS 204: Integrative marine sciences

10

Floating hull stability

Explain why the kayak (in the picture with the head up) is less stable than the ship.

1/31/17

SMS 204: Integrative marine sciences

11

Buoyancy issues for marine organisms:

- Blubber is buoyant (0.7-0.9g cm⁻³)
- Muscles (1.08g cm⁻³) and bones (1.9g cm⁻³) are denser than water
- Air is buoyant (but compressible, that is buoyancy changes with pressure (depth))

Some strategies:

- Air in stomach (some sharks).
- Swim bladder (many bony fishes, physiologically regulated).
- Large oily liver (Sharks).

13

Buoyancy change of floats and gliders

1/31/17

SMS 204: Integrative marine sciences

14

- **Energy:**
 - Capacity to do work (force x distance).
 - Kinetic energy: $mv^2/2$ [(m) (L² T⁻²)]
 - Pressure-volume energy: PV [(m L⁻¹ T⁻²)(L³)]
 - Potential energy: mgh [(m) (L T⁻²) (L)]
 - Other: internal energy, heat, light.
- Conservation of energy: $mv^2/2 + mgh + PV = \text{constant}$
where we neglected friction.

Conservation of energy per unit mass: $v^2/2 + gh + P/\rho = \text{constant}$ ← Bernoulli's principle

1/31/17

SMS 204: Integrative marine sciences

15

Important to remember:

1. Holds only along a streamline (within a parcel of water)

2. Can convert kinetic energy here to pressure somewhere else.

Different forms:

$$v^2/2 + gh + P/\rho = \text{constant}$$

What is this?

$$\rho v^2/2 + \rho gh + P = \text{constant}$$

$$v^2/2g + h + P/g\rho = \text{constant}$$

1/31/17

SMS 204: Integrative marine sciences

16

Based on Bernoulli's principle:

How would pressure change along a fluid as it flows through a constriction?

Movie clip

Demo

1/31/17

SMS 204: Integrative marine sciences

17

Based on Bernoulli's principle: How can we measure the velocity of a fluid using only pressure?

Answer: the pitot tube

1/31/17 SMS 204: Integrative marine sciences Homework question 19

Velocity, static and pressure heads for pipe flow

$$u^2/2g + z + P/\rho g = \text{constant}$$

At point 1, there is no velocity or pressure, so it's all static head.

At point 2, there are all three kinds of heads.

There is some loss of head as friction (shear) to heat.

Relevant vertical distances at point 2 are:

Velocity head = $u^2/2g$

Pressure head = $p_2/\rho g$

Static head = z_1, z_2

Sum = Total head

1/31/17 SMS 204: Integrative marine sciences 20

Application: flow above a disturbance (Clams, ripples, houses, etc').

Hüttel, M., W. Ziebis and S. Forster. 1996. Flow-induced uptake of particulate matter in permeable sediments. *Limnol. Oceanogr.* 41: 309-322. (Source of figure)

1/31/17 SMS 204: Integrative marine sciences 21

Generate flow of small particles and solutes into/out of sediments:

Hüttel, M., W. Ziebis and S. Forster. 1996. Flow-induced uptake of particulate matter in permeable sediments. *Limnol. Oceanogr.* 41: 309-322. (Source of figure)

1/31/17

SMS 204: Integrative marine sciences

22

Today we discussed the following topics:

Buoyancy.

Energy conservation in fluids.

Dynamic pressure.

Questions?
