

- absorption function (for irradiance), 12, 97
 simple formula for in asymptotic light field, 255
 apparent optical property, 106, 178, 181
 transport equations for 271
 asymptotic form of light fields, 95
 criterion for asymptoticity, 254
 asymptotic radiance hypothesis, 212
main mathematical proof (using canonic equation for K), 213-227
 integral equation for limit radiance distribution, 228, 237, 245
 theoretical and experimental example, 229, 230
simple proof (using exponentiality of $h(z)$), 230
 practical consequences, 238
 K characterization of hypothesis, 242
 critique of Whitney's "general law", 248
heuristic proof (using differential equation for K), 253
 attenuation functions (for irradiance), 11
 depth dependence, 25
 for radiance, 264
 for irradiance, 265
 for scalar irradiance, 270
 for reflectance, 149, 279
 for K -function, 275
 for other concepts, 281
 attenuating functions
 depth dependence, 25
 backward scattering functions, 11, 141
 boundary effects, 46, 71
 characteristic equation
 for second order differential equation, 39
 for K -function, 123, 252
 canonical forms of transport equation for κ functions, 273
 canonical representation of irradiance fields, 98
 catalog of K -figurations (shallow depth theory), 201
 nondegenerate
 degenerate
 first, second kind
 forbidden, 202
 classical models for irradiance fields, 19
 collimated-diffuse light fields, 19
 isotropic scattering models, 23
 connections with diffusion theory, 24
 classical theory, inadequacies, 115
 complete (general) solution of irradiance equations, 42
 complete reflectance for irradiance, 4, 62, 64, 79
 complete transmittance for irradiance, 4, 62, 64, 79
 contrast, 165
 contrast transmittance, 162
 properties, 168
 in canonical equation for radiance, 170
 alternate representations, 171
 as an apparent optical property, 172
 effect of shadows on, 174
 contravariation of K and D , 144
 convariation of K and D , 128, 136, 140
 rule of thumb, 145
 decomposed (diffuse) irradiance, 14
 diffuse absorption coefficient, 111
 diffuse (decomposed) irradiance, 14
 transmittance for, 17
 diffusion theory, 24
 Dirac matrices, 8
 directly observable optical properties, 109, 178
 discrete-space radiative transfer, 51
 distribution function, origin, 10
 for diffuse irradiance, 15
 representative values, 26
 representation via radiance distribution, 27
 depth dependence, 26
 in canonical equation for irradiance, 99

- distribution function--Cont'd.
 experimental, 115
 contravariation (with K-function), 144
 covariation (with K-function) 128, 136, 140
 physical and geometrical features, 128
 asymptotic limits, 246
- equilibrium radiance function, 151
 for radiance, 151
 for irradiance, 13, 265
 for scalar irradiance, 270
 for reflectance, 149, 279
 for K-functions, 275
 for other concepts, 281
- equilibrium-seeking theorem
 for R , 152
 for N , H , h , 270
 and universal radiative transport equation, 279
- equivalence theorem for $R(z, -)$, 159
- fine structure of light field hypotheses, 199
 special relations, 208
- first standard solution α two-D model
- forward scattering functions, 11, 141
- forward scattering media, 140
- fundamental optical property, 107, 178
- global optical property, 107, 180
- inequalities (among optical properties), 114, 119
- inherent optical property, 106, 178, 180
- interacting media (invariant imbedding operators for), 76
- internal sources and irradiance fields, 37, 55, 81
- invariant imbedding relation for irradiance fields, 2, 61
 in two-D model, 36
 including boundary effects, 50
 for interacting media, 76
- irradiance (two-flow) equations, 6
- irradiance fields,
 invariant imbedding relation for, 2
- irradiance fields--Cont'd.
 equilibrium, 13
 decomposed (diffuse) 14
 residual, 15
 classical models, 19
 two-D models, 25
 primary scattered, 43
 boundary effects, 46
 method of modules, 80
 internal source, 37, 55, 81
 vector model for, 87
 curl and divergence of, 91
 global properties, 97
 canonical representation, 98
 shallow depth theory, 187, 193
 fine structure hypotheses, 199
 in asymptotic setting, 238
- isotropic scattering (in vector light field model), 94
 models, 23
- K-function
 two-D model, 31, 39
 one-D model, 53, 56
 in canonical equation, 100
 theoretical forms, 111
 diffuse absorption coefficient, 111
 experimental, 115
 significance of sign, 120
 characteristic equation for, 123
 connections among (irradiance K-functions), 123
 general forms, 125
 for radiance, 125
 integral representations, 126
 in spherical coordinates, 127
 contravariation (with distribution function), 144
 covariation (with distribution) 128, 136, 140
 physical and geometrical features, 128
 absorptionlike character (for irradiance), 138
 genealogy of configurations for shallow depths, 201
 asymptotic limits, 246
 canonical form of transport equations for, 273
- local optical property, 107, 179, 180

- local transmittance and reflectance, 7
- many-D models, 57
- method of modules for irradiance fields, 80
- monotonicity condition on radiance distribution, 28
- one-D models for irradiance fields, 51
 for undecomposed fields, 52
 internal sources, 55
 for decomposed fields, 56
 connections with observable fields, 160
- ontogeny (family roots) of two flow equations, 13
- optical medium, definition, 108
- optical properties, inherent, apparent, 106
 local, global, 107
 fundamental, 107
 general definition, 109
 directly observable, 109
 classification, 178
 in asymptotic light fields, 238
- Pauli matrices, 8
- polarity of R,T ractors, 34
- primary scattered irradiance, 43
- principles of invariance
 global (for irradiance), 2
 local (for irradiance), 7
 for diffuse irradiance, 18
- quantum mechanics
 formal similarity with, 8
- quasi-irrotational light field, 88
- R_∞ formulas, 113
- radiance
 equilibrium, 151
 transmittance, 164
 multiplicity of representations, 177
- reduced (residual) irradiance, 15
- reflectance
 for irradiance (undecomposed), 3
 in two-D model, 33, 35, 45
 complete (two-D), 62
 complete (one-D), 64
- reflectance--Cont'd.
 differential equations, 65, 79, 123, 148
 R_∞ formulas, 113
 experimental, 115
 connections with attenuating functions, 118
 analytic representation, 146
 equilibrium-seeking property, 150
 integral representations of $R(z,-)$, 156, 196
 equivalence theorem for $R(z,-)$, 159
 equilibrium and attenuation functions, 149
 asymptotic limits, 246
 regular neighborhoods of paths, 166
 residual (reduced) irradiance, 15
- scattering functions (for irradiance)
 forward, backward, 11, 141
 total, 12
 for decomposed irradiance, 16
 forward scattering media, 140
- second standard solution of two-D model, 34
- semigroup properties (third order) for reflectance and transmittance factors, 67
- semigroup property for contrast transmittance, 169
- shallow depth theory (of irradiance field)
 experimental basis, 187
 formulation, 193
 comparison with experiment, 197
- simple model for radiance distributions, eventual exactness, 249
- standard ellipsoid (for radiance distribution), 250
- submarine light field, general representation, 93
- total scattering functions, 12
- transmission line equations
 formal similarity with, 8
- transmittance, for irradiance (undecomposed), 3

- transmittance--Cont'd.
 - for reduced and diffuse irradiance, 17
 - in two-D model, 33, 35, 45
 - complete (two-D), 62
 - complete (one-D), 64
 - differential equations, 65, 79
 - for radiance, 164
- two-D models for irradiance fields, 25
 - for undecomposed fields, 30
 - first standard solution, 31
 - second standard solution, 34
 - for internal sources, 37
 - for decomposed fields, 43
 - inadequacies, 115
 - eventual exactness, 247
- two-flow equations (for irradiance), 6
 - undecomposed form, 8
 - decomposed form, 14
 - equilibrium form, 13
 - ontogeny, 13
 - for reduced irradiance, 17
 - two-D (undecomposed) model, 30
 - standard solutions, 31-34
 - complete (general) solution, 42
 - for decomposed irradiance, 43
 - boundary conditions (effects), 46
 - one-D (undecomposed) model 52
 - many-D models, 57
 - exact vs. two-D, 115
 - asymptotic behavior, 247
- universal radiative transport equation, 263
 - for radiometric concepts, 263
 - for apparent optical properties, 271
 - and equilibrium principle, 279
 - standard cases, 281
 - additional cases, 281
- vector irradiance field, model for, 87
- Whitney's "general law" of diminution of light field with depth, 248
