

VOLUME VI

Chapter 12

Optical Properties of the Air-Water Surface

12.0	<u>Introduction</u>	1
12.1	<u>Reflectance and Transmittance Properties of the Static Surface</u>	3
	The Geometric Law of Reflection	3
	The Geometric Law of Refraction	5
	The Fresnel Laws for Reflectance	10
	The Fresnel Laws for Transmittance	15
	Example 1: Reflectance Under Uniform Radiance Distributions	16
	Example 2: Reflectance Under Cardicidal Radiance Distributions	21
	Example 3: Reflectance Under Zonal Radiance Distributions	28
12.2	<u>Radiative Transfer and the Static Surface</u>	34
	Irradiance Interaction Between the Surface and the Hydrosol	35
	The Threefold Irradiance Interaction: Aerosol, Air-Water Surface, and Hydrosol	38
	The Threefold Radiance Interaction: for the Static Surface	39
	Contrast Transmittance Formulas for the Static Surface	41
	Contrast Transmittance Formulas for Extended Paths Across the Static Air-Water Surface	44
12.3	<u>Elementary Hydrodynamics of the Air-Water Surface</u>	46
	The Fluid Transfer Process	46
	Physics of the Fluid Transfer Process	47
	General Equations of Motion of a Fluid	49
	Special Equations of Motion for the Air and Water Masses	51
	Surface Kinematic Condition	55
	Surface Pressure Condition	57
	Sinusoidal Wave Forms	60
	Linearized Equations of Motion	62
	Classical Wave Model	63
	Kelvin-Helmholtz Model	67

12.3	<u>Elementary Hydrodynamics of the Air-Water Surface--Continued</u>	
	Kelvin-Helmholtz Instability	70
	Capillary and Gravity Waves	71
	Energy of Surface Waves	72
	Superposition of Waves	76
	Spectrum of the Air-Water Surface	78
12.4	<u>Harmonic Analyses of the Dynamic Air-Water Surface</u>	82
	The Roots of Harmonic Analysis	83
	Harmonic Synthesis vs. Harmonic Analysis	84
	Integrals vs. Series in Harmonic Analysis	86
	Fourier Series Representations of the Air-Water Surface	87
	Hydrodynamic Basis for Harmonic Analysis of Air-Water Surfaces	91
	The Periodogram Basis of the Energy Spectrum	94
	Fourier Integral Representations of the Air-Water Surface. Case 1: The Surface is Aperiodic	101
	Fourier Integral Representations of the Air-Water Surface. Case 2: The Surface is Periodic or Random	109
	A Working Representation of the Dynamic Air-Water Surface and its Directional Energy Spectrum	115
	Geometrical Applications of the Directional Energy Spectrum	120
12.5	<u>Wave Slope Data</u>	132
	The Logarithmic Wind Profile Model	132
	Visual Observations on Wave Slopes	133
	Hulburt's Observations of Wave Slopes	136
	Duntley's Immersed-Wire Measurements of Wave Slopes	138
	Intuitive Picture of the Gaussian Slope Distribution	142
	The Wave-Slope Wind-Speed Law (Duntley)	145
	Cox and Munk's Photographic Analysis of the Glitter Pattern	145
	The Wave-Slope Wind-Speed Law (Cox and Munk)	149
	Schooley's Flash Photography Measurements of Wave Slopes	151
12.6	<u>Wave Generation and Decay Data</u>	152
	Generation of Waves: Shallow Depths, Small Fetches	153
	Generation of Waves: Deep Depths, Large Fetches	157
	Decay of Waves	161
12.7	<u>Wave Spectrum Data</u>	166
	Wave Spectra by Aerial Stereo Photography	166
	Wave Spectra by Floating-Buoy Motion	173
	Wave Spectra from Submarine Echo Recordings	180

CONTENTS

v

12.8	<u>Empirical Wave Spectra Models</u>	181
	The Neumann Spectrum	181
	Derivation of the Neumann Spectrum	183
	Three Laws Derived from the Neumann Spectrum	186
	Alternate Forms of the One-Dimensional Spectrum	189
	General Properties of Gamma Type Spectra	190
	Wind Speed, Wavelength, and Wave Energy	193
12.9	<u>Theoretical Wave Spectra Models</u>	194
	The Wave Elevation Distribution	194
	The Wave Slope Distribution	197
	The Wavelength Distribution	202
	The Bretschneider Spectrum	204
	The Wave Height Distribution	205
	Models of Wind-Generated Spectra	205
	Spectral Transport Theory	208
12.10	<u>Instantaneous Radiance Field Over a Dynamic Air-Water Surface</u>	210
	The Geometrical Setting	211
	The Integral Equation for the Instantaneous Surface Radiance $N_{\dagger}^{\dagger}(S)$	212
12.11	<u>Time-Averaged Radiance Field Over a Dynamic Air-Water Surface</u>	216
	Direct and Indirect Radiance Averages	216
	The Stationarity Condition	219
	The Independence Condition	220
	The Weighting Functions	221
	The Time-Averaged Integral Equation for $N_{\dagger}^{\dagger}(S)$	222
	Structure of the Weighting Functions	224
	The Instantaneous and Time-Averaged Equations for $N_{\dagger}^{\dagger}(S)$	234
12.12	<u>Instantaneous and Time-Averaged Radiance Fields Within a Natural Hydrosol</u>	237
	Two Types of Time-Averaged Radiance Fields	238
	Equations of Transfer for Time-Averaged Radiance Fields	239
	Connection Between Fixed Depth and Cosurface Time-Averaged Radiances	243
12.13	<u>Synthesis of Time-Averaged Radiance Fields</u>	246
	Comparison with the Static Case	250
12.14	<u>Observations on the Theory of Time-Averaged Radiance Fields for Dynamic Air-Water Surfaces</u>	250
	A Hierarchy of Approximate Theories	251
	Illustrations of Some Classical Partial Theories	253
	Concluding Observations	260

12.15	<u>Simulation of the Reflectance of the Air-Water Surface by Mechanical Devices</u>	260
	The Central Idea of the Sea State Simulator	261
	Ergodic Hypothesis	261
	The Discrete Case	263
	The Continuous Case	266
	Some General Observations on the Ergodic Cup Device	268
	Sea Simulator Devices Beyond the Ergodic Cup	269
12.16	<u>Bibliographic Notes for Chapter 12</u>	269
Chapter 13		
Operational Formulations of Concepts for Experimental Procedures		
13.0	<u>Introduction</u>	273
13.1	<u>Operational Definitions of the Principal Radiometric Concepts</u>	273
	Radiant Flux	274
	Irradiance	274
	Spherical Irradiance and Scalar Irradiance	278
	Radiance	281
13.2	<u>Operational Definition of Beam Transmittance</u>	284
	General Two-Path Method	285
	General One-Path Method	286
13.3	<u>Operational Definitions of Path Radiances and Path Functions</u>	287
	Operational Formulation of Path Radiance	287
	Operational Formulation of Path Function	288
13.4	<u>Operational Definition of Volume Attenuation Function</u>	290
	Canonical Equation Method	292
13.5	<u>A General Theory of Perturbed Light Fields, with Applications to Forward Scattering Effects in Beam Transmittance Measurements</u>	293
	Introduction	293
	General Representation of a Perturbed Light Field	295
	Linearized Representation of Slightly Perturbed Light Fields	297
	Application to Bright-Target Technique	299
	Application to Dark-Target Technique	300
	An Outline of Possible Experimental Procedures of α in Perturbed Light Fields	302
	Order of Magnitude Estimates	305
	Summary and Conclusions	307

13.6	<u>Operational Definition of Volume Scattering Function</u>	308
	σ -Recovery Procedures	312
	Determining the Volume Scattering Matrix in the Polarized Case	314
13.7	<u>Direct Measurement of the Volume Total Scattering Function</u>	316
	The General Method	317
	Observations	318
	Two Special Methods	319
	Cylindrical Medium	319
	Spherical Medium	320
13.8	<u>Operational Definition of Volume Absorption Function</u>	321
	Procedures for Stratified Light Fields	322
	Procedures for Deep Media	323
	General Global Method	323
	Further Procedures for General Media	323
13.9	<u>Operational Procedures for Apparent Optical Properties</u>	324
	The Fundamental Irradiance Quartet	325
	Discussion of the Reflectance Functions	327
	Discussion of the Distribution Functions	329
	Discussion of the K-Functions	330
13.10	<u>Theory of Measurement of Local and Global R and T Properties</u>	331
	Example 1: R and T Factors in Homogeneous Polarity-Free Settings	332
	Example 2: Homogeneous Media with Polarity	333
	Example 3: Forward and Backward Scattering Functions	335
	Example 4: R and T Operators for Radiance	337
	General Observations on Inverse Problems in Hydrologic Optics	339
13.11	<u>On the Consistency of the Operational Formulations</u>	339
	On the Relative Consistency of the Unpolarized and Polarized Theories of Radiative Transfer	341
13.12	Bibliographic Notes for Chapter 13	345
	Bibliography for Volumes I-VI	347
	Index to Volumes I-VI	369
